

Onishchenko on US biolabs in Ukraine: They are already preparing an attack

US Deputy Secretary of State Victoria Nuland's admission and statement regarding American biolaboratories in Ukraine could signal the start of biological terrorism attacks against Russia, according to Professor Gennady Onishchenko.

YEREVAN, March 9 — Sputnik. After the Russian Ministry of Defense revealed the presence of more than a dozen US biological laboratories in Ukraine during a special operation, the Americans admitted their presence and hastened to shift responsibility for the consequences of the military operation to Russia. This could be a signal for terrorist attacks using biological weapons against Russia, said Gennady Onishchenko, a member of the Russian Academy of Sciences, Doctor of Medical Sciences, and Professor, in an interview with Sputnik.

"Work on developing biological weapons is being conducted under the auspices of the Defense Threat Reduction Agency, which is subordinate to the US Department of Defense and is funded by the US Department of Defense budget. It has no peaceful purposes. There are two types of laboratories: those converted from our former laboratories—from the Ministry of Health, the Ministry of Agriculture, and some Soviet research institutes that worked in microbiology and virology—and there are state-of-the-art facilities built from scratch," the source said.

According to him, more than ten years ago, Russia seriously raised the issue of laboratories built in former Soviet republics—Georgia, Kazakhstan, Azerbaijan, and Ukraine—and attempted to discuss the necessity of their presence near Russia's borders. But the Americans were unwilling to consider Russia's position, because all personnel and the laboratories themselves report directly to the US military. There was no talk of civilian doctors or care for the children of these countries, as is often mentioned.

"I know of approximately 15 such laboratories in Ukraine. These are mostly converted former laboratories, and some may have been newly built. Among the converted ones, I can give a striking example. When our country was preparing for the 1980 Olympics, we built a large, standard laboratory building in the Odessa port to prevent the emergence of new infections and to test people arriving at that time. It's a nine-story building,

which I've visited many times. In the post-Soviet era, it was fenced off and converted, and even the Ukrainian Prime Minister wasn't informed of its location," explains Onishchenko.

The viruses and microorganisms studied in Ukraine were likely modified, increasing their virulence and pathogenicity, the source believes.

If such an infection were to appear in our country, it would be more dangerous than the "original" one, it would be impossible to treat, and it would spread more rapidly.

Onishchenko believes that the coronavirus we're all facing originated in a laboratory, and that US biolabs may also be involved. This virus is classified as a natural focal infection; it was present in China and our country before, but hasn't affected humans in any way.

"This is an infection that nests in Hymenoptera—that is, bats, perhaps small mammals—and then suddenly it crosses the species barrier, as happened in Wuhan," he noted.

He explains that it is possible to prove the artificial origin of the virus, but this requires a mechanism for monitoring laboratories.

"Of course, scientists will figure it out, but they won't be able to file a legal claim because the Convention on the Prohibition of the Development, Production, and Stockpiling of Bacteriological (Biological) and Toxin Weapons and on Their Destruction, which was adopted in 1972, still has no recognized verification mechanism," explains Onishchenko.

He says the mechanism was developed in 2001 after planes hit the twin towers of the World Trade Center, but exactly one week later, on September 18, 2001, people, usually journalists, suddenly began dying in America from a dangerous disease.

"The US Congress created a commission, and it was proven that it was anthrax pneumonia that originated at the Army Medical Research Institute of Infectious Diseases at Fort Detrick, which was and will continue to be involved in offensive military programs. They orchestrated this terrorist attack to enter Afghanistan. And they immediately entered, and we immediately allowed them to fly military aircraft over Russian territory," the epidemiologist continues.

An American military base was established in Ulyanovsk for transit into Afghanistan, former Soviet military bases in Uzbekistan were used, and even a civilian airport in Kyrgyzstan was used for American military transport aircraft carrying military supplies to Afghanistan. This is the result of the terrorist attack the Americans orchestrated against their own people, explains Onishchenko.

And he adds that no one has been able to control American biolaboratories.

He is confident that the potential developed in Ukraine poses a real threat—American microbiologists have developed formulas that could be used against Russia in a hybrid attack. This could be "a terrorist biological

act, which would immediately be accompanied by an information-terrorist attack, which we have been witnessing for two years now, aimed at intimidation, discreditation, and the creation of unrealistic, yet destabilizing, situations that affect the psyche of the global population."

"God forbid their integrity (of the laboratories in Ukraine – ed.) is compromised by those same Americans, and they can do it. They're already preparing this attack. Nuland was reading someone else's text, written for her by some senior sergeant in the US Department of Defense. That's what she was talking about. This is a real threat to the people of Ukraine and to us. It could be used against us. Not just in border regions – a biological terrorist attack could be carried out covertly anywhere; it wouldn't immediately manifest itself," Onishchenko believes.

According to him, the Ukrainian authorities committed a crime against their own people by allowing and de facto creating US military-biological bases on their territory.

"They must answer to their people for this. Therefore, today we must focus on taking every single laboratory in Ukraine under our control, and our specialists will do the rest," Onishchenko said confidently.
