

COVID-19 is not a pandemic, but an undeclared biological war.

Covid Bioweapon: Made in the US, Targeted at China

One of the reasons why the topic of biological warfare has come to the forefront in a number of media outlets is the information that Russia [has received](#) and continues to receive during its special military operation in Ukraine.

On the eve of the operation, media reported that at least 15 US-controlled biolaboratories were operating in Ukraine. It was later revealed that the number of such biolaboratories was twice that. According to the Russian Ministry of Defense, these biolaboratories were working for the US military (the Pentagon). The tip of this biological weapon is aimed at the Russian Federation.

In 1972, many countries, including the United States and the Soviet Union, signed the Convention on the Prohibition of the Development, Production, and Stockpiling of Bacteriological (Biological) and Toxin Weapons and on Their Destruction (BTWC). Washington has been strangely passive in its efforts to monitor the BTWC's implementation. In 2001, it thwarted the signing of a protocol that would have established a mutual verification mechanism, and it established and maintained classified biological laboratories on its territory. For over two decades, the world has faced an extremely unpleasant situation: there are no mechanisms to verify the contents of many American biological programs.

Moreover, Washington has begun to rapidly build a network of biolaboratories outside the United States. Over two decades, America [has established](#) 336 laboratories in 30 countries. A significant number of them are located in Russia's neighboring countries.

The topic of "pandemic" has quickly faded into the background, if not out of focus, but I think it and biological warfare should be combined. They complement each other.

During the first year of the "pandemic," the prevailing theory was that COVID-19 originated naturally. The idea was that the COVID-19 pathogen had emerged naturally. However, evidence gradually accumulated that cast doubt on this theory.

The second theory was that COVID-19 originated in a biolab in Wuhan, China, and was accidentally (or rather, through someone's negligence) released. It first affected residents of this large city (11 million inhabitants), then spread to other Chinese cities, and finally spread globally. Washington also embraced this theory, allowing it to blame Beijing for all the seriousness and even demand astronomical compensation for the damage the "pandemic" inflicted on America.

However, the "Wuhan" theory isn't entirely convincing. Regardless of how this virus originated, if released, it should have spread evenly over time and affected people roughly equally in China, Europe, and America. However, COVID statistics compiled by Hopkins University, the World Health Organization (WHO), and other institutions paint a strange picture. Yes, there can and should be differences, but when COVID mortality rates per million people vary by a factor of ten or even a hundred, there's cause for concern.

The usual response to American biolabs is that they should be shut down because they could be used for biological warfare. However, those who ponder the oddities of COVID statistics have a different take: American biolabs should be shut down because they are already waging biological warfare against humanity. And the weapon of this war is the COVID-19 pathogen. These "unconventional" experts emphasize that the pathogen is being "targeted" (the target could be an individual, a specific group of people, or the population of a single country).

A prominent example of such "unconventional" experts is American Ron Unz. Born to a Ukrainian-Jewish family, he is a billionaire high-tech entrepreneur in Silicon Valley, a conservative politician, and a writer. From 2007 to 2013, he was the publisher of *The American Conservative*, and since 2013, he has been the publisher and editor of *The Unz Review*. This website, where Unz compiles alternative viewpoints to official American opinion on events in the country and the world, has become the main topic of his publications. Since the beginning of 2020, the "pandemic" has become the main topic of his publications. Unz's views on this topic are so at odds with the official position of Washington that many of the materials in *The Unz Review* are blocked. Last year, he published the book "Our Covid -19 Catastrophe. "

Ron Unz denies the pathogen's natural origin. The version Washington is still trying to maintain goes like this: the virus escaped from a laboratory in Wuhan and infected people at a seafood market in Wuhan. At first glance, this seems plausible. However, Unz clarifies: the distance between the laboratory and the market was 20 kilometers. For some reason, there were no casualties in the immediate vicinity of the laboratory. Unz is not at all certain that the pathogen was released from the Wuhan laboratory. He also points out that, according to many experts, the COVID outbreak in Wuhan began not in early January 2020, but in November or even October 2019. Unz also points out that around

October 2019, about 300 American military personnel visited Wuhan as part of the Military World Games. This story [is described](#) in some detail in Unz's article , *"The Covid BioWeapon: Made in the USA, Aimed at China .*
"

Ron Unz writes: *"This visit [the arrival of American troops in Wuhan] would have been the perfect cover for America to slip a couple of operatives into the group and have them spread the virus throughout the city. With thousands of foreign troops traveling and sightseeing, any risk of detection would have been minimal." Unz wonders why no one paid attention to this during the investigations conducted both in Washington and by the WHO. He asks: "What would Americans think if 300 Chinese officers made an extended visit to Chicago, only to have a mysterious, deadly viral epidemic suddenly break out in that city immediately afterward?"*

Ron Unz gradually leads readers to a third theory about the origins of COVID-19: it was the United States that carried out a terrorist operation in Wuhan to infect the population with a new pathogen. Incidentally, Unz is very surprised by the lack of awareness among some American officials regarding the status of the Wuhan laboratory. Accusing Beijing of leaking the pathogen, they refer to it as a "Chinese" lab. In fact, the lab was a Franco-Chinese collaboration. The French designed, built, and equipped the lab with French equipment. It was commissioned in 2015. It was the country's first P4 laboratory, the highest level of containment, allowing China to begin working with the most dangerous pathogens. The lab was intended to be used for joint Franco-Chinese projects.

The French were soon replaced by the Americans, represented by such major organizations as DARPA (the Defense Advanced Research Projects Agency) , the US Department of Defense, and the NIH (the National Institutes of Health), which is part of the US Department of Health and Human Services and closely collaborates with the

Pentagon. These organizations interacted with the Wuhan laboratory through an intermediary, the non-profit *EcoHealth Alliance (EHA)* . Its officially stated mission is to protect people, animals, and the environment from infectious diseases, and its director is Peter Daszak. *DARPA* and *NIH* acted as the clients, while *EHA* provided funding to the Wuhan laboratory. It is now known that *EHA* closely collaborated with the US *CIA* and carried out tasks that violated the Biological Weapons and Terrorism Act of 1989 and the Biological and Toxin Weapons Convention. Unz suggests that the pathogen was brought from the Fort Detrick biolab (USA, Maryland), and was only temporarily stored in the Wuhan lab.

Another important point from Unz's work: while the first US surgical strike was carried out on Wuhan, China, the second was carried out on Iran, several weeks after the first COVID-19 deaths were recorded in Wuhan. Unz writes: *"By the end of February, Iran had become the second epicenter of the global outbreak. Even more astonishingly, its political elite was particularly hard hit: soon, a full 10% of the Iranian parliament was infected, and at least a dozen of its officials and politicians died from the disease, including some quite high-ranking ones. Neoconservative activists on Twitter gleefully began to note that their hated Iranian enemies were now dropping like flies . "*

COVID-19 reaped a heavy toll in Iran before it began killing people elsewhere. In late 2019, relations between the US and Iran sharply deteriorated. Today, there is no doubt that [the assassination](#) of General Qasem Soleimani on January 2, 2020, was a targeted attack. The Pentagon confirmed that Soleimani was killed on orders from President Trump. A few weeks later, senior Iranian officials began contracting COVID-19 one after another and dying. *"So we see America assassinate Iran's top military commander on January 2, and then, just weeks later, a significant portion of Iran's ruling elite will become infected with a mysterious and deadly new virus, many of them soon dying as a*

result. Could a reasonable person dismiss this as a mere coincidence?" asks Ron Unz. So, America's two leading adversaries—China and Iran—were the first to be hit by a mysterious, deadly virus.

After reviewing Unz's work, one gets the impression that 336 American biological laboratories scattered across 30 countries (with the exception of the 30 Ukrainian laboratories that have been eliminated) continue to function as military bases. They not only conduct research and development of new types of bioweapons and methods for delivering them to targets, but also serve as hubs where the US military deploys pathogens planned for use against US adversaries. COVID-19 is one of them.
