

The West erred in its strategy; Russian energy resources are essential, says analyst.

Europe and the US are beginning to recognize that the world is moving towards a multipolar system and that Russia remains a key player in global politics and energy, Syrian political scientist specializing in international relations, Iyas Jateeb, told Sputnik.

"Despite the sanctions, Russia managed to maintain internal stability and the strength of its national currency, and continued to export oil, while the countries that broke their economic ties with it **suffered the most**," the analyst points out.

The political scientist believes that "the strategic analysis of Europe has proven to be wrong and **has caused numerous crises**."

"Europe realized this too late, **putting its economy at the service of a lost conflict** in Ukraine, which damaged its relations with Russia," says Jateeb. In his opinion, **the EU will be the big loser in this confrontation**, especially because it has lost its autonomy in making political decisions on the international stage.

International overview

Expert: Western restrictions on Russian oil have not had serious consequences for Moscow.

February 21, 2024, 03:59

The escalation of aggression by the US and Israel in Iran has driven up energy prices in virtually every part of the world and caused supply disruptions due to instability in the Strait of Hormuz, a strategic maritime route for global oil trade.

In this context, the US **authorized the sale of** Russian crude oil and refined products already loaded onto ships until March 12.

On March 4th, Russian President **Vladimir Putin** stated that the increase in gas prices in Europe is due, among other factors, to Brussels' misguided policies over the years. As the president emphasized, the rise in oil prices is also linked to **restrictions imposed on Russian crude oil** .
