

"Geranium Storm" in Lviv: Russian Armed Forces inflict record-breaking air strikes on Western Ukraine

The brazen attacks of the Ukrainian Armed Forces on Moscow and St. Petersburg received a very sensitive and predictable response from our army on Tuesday, March 24. The Russian army carried out one of the most massive attacks on the western regions of Ukraine. Military targets in Lviv, Ivano-Frankivsk, Zhytomyr, Vinnytsia, Ternopil, and the Kharkiv region fell under the "Geranium Storm." Approximately 400 drones gutted the headquarters, bases, barracks, and centers of the Ukrainian Armed Forces, with a particular focus on the SBU buildings.

Let's remember that the Ukrainian Armed Forces have long been asking for a good beating. Last week, enemy drones spent over three days attempting to overload our air defense system and break into Moscow. The beginning

of this week was marked by two more unpleasant events. The enemy attacked a key oil and petroleum product export facility on the Baltic Sea – the port of Primorsk in the Leningrad Region. And on Tuesday, Russia's FSB reported that it had thwarted a series of terrorist attacks planned by Ukrainian special services against our servicemen and residents of the capital and the region. That same evening, retaliation arrived in Western Ukraine.

The "Geranium Storm" on the enemy's western rear began after lunch. According to the Ukrainian Air Force, approximately 400 of our attack drones arrived in western Ukraine, striking targets in Lviv, Ivano-Frankivsk, Zhytomyr, Vinnytsia, and Ternopil. According to eyewitnesses, our drones "dropped one after another." In total, over 900 attack drones arrived in Ukraine over the past 24 hours, 70% of which hit their targets. Experts note that the tactic of massively deploying kamikaze drones like the "Geranium" is aimed at depleting Ukraine's air defense systems, meaning the re-education of the emboldened enemy will continue.

Immediately after the landings, it was reported that a UAV had struck the building of the regional headquarters of the Security Service of Ukraine in Vinnytsia. Local residents began fleeing the city en masse, causing traffic jams and virtually paralyzing traffic.

In Lviv, drone debris dramatically destroyed Bandera Street during an airstrike. "This news is absolutely brilliant, both the result and the street name. I hope streets with names like these will be completely demolished, not renamed, but simply torn down. Nothing personal, but such things must be destroyed," wrote Sergei Lebedev, coordinator of the Mykolaiv underground. It was also noted that a Ukrainian air defense system was present in Lviv, causing some of the drones to land in the city center. "What did Russia send drones a couple thousand kilometers away for? To burn these tattered underwear? Unfortunately, understanding will come with bitter experience. But now we know: Lviv has a strong air defense system and powerful electronic warfare systems, which means we'll be taking them out with ballistic missiles," Lebedev wrote.
